192011139

# Kali Linux Basic Commands

# 1. Date Command

In Kali Linux, the 'date' command is used to display the system date and time. In order to display the date, we have to use the following command:

## **Syntax:**

1. # date

```
<mark>(kali⊕kali</mark>)-[~]
$ date
Fri Jan 27 09:06:24 AM EST 2023
```

## 2. Cal Command

The cal command displays the current **month's formatted calendar** on our terminal screen. If we require a more advanced version of **cal**, we can install the **ncal package** on our Linux machine, which displays the calendar vertically and provides additional options.

## **Syntax**

1. # Cal

```
    (kali ⊕ kali) - [~]

    $ cal

    October 2021

    Su Mo Tu We Th Fr Sa

    1 2

    3 4 5 6 7 8 9

    10 11 12 13 14 15 16

    17 18 19 20 21 22 23

    24 25 26 27 28 29 30

    31
```

## 3. Cd Command

The 'cd' command is also called **chdir** (Change Directory). We used this command to **change** or **switch** the current working directory.

```
(kali@ kali)-[~]

$ cd Desktop

(kali@ kali)-[~/Desktop]

$ ls

Files firebox keyboard.png key.png
```

# 4. cp Command

In Kali Linux, the 'cp' command is used to copy files or a group of files or directories that create an exact image of a file on a disk with a different file name.

```
(kali@ kali)-[~]
$ cd Desktop

(kali@ kali)-[~/Desktop]
$ ls

Files firebox keyboard.png key.png

(kali@ kali)-[~/Desktop]
$ cp key.png files
```

# 5. whoami Command

The 'whoami' command is used to print the effective user ID whereas the who command prints information regarding users who are presently logged in.

The "w" command can also be used to view who is logged on and what they are doing.

```
(kali@ kali)-[~]

$ whoami
kali

(kali@ kali)-[~]

$ who
kali tty7 2023-01-27 08:51 (:0)
```

#### 6. Ls Command

One of the most useful commands in Kali Linux is the 'Is' command. The Is command lists the directory contents of files and directories. With the help of the Is command, we can easily list out every hidden file of a directory with the -a attribute, and for more detailed output, we can use the -I attribute.

# **Syntax**

1. # ls -al

```
[ (kali® kali)-[~]
 total 9416
                                                                       4096 Jan 27 09:09 .

#### 7. Cat Command

The 'cat' (concatenate) command is one of Kali Linux's most commonly used commands, permitting us to create single or many files, concatenate files and redirect, view contain of file output in terminal or files.

Usually, we use the cat command to display the content of a file.

1. # cat filename

```
(kali@ kali)-[~]
$ echo "Welcome to JavaTpoint" > file.text

(kali@ kali)-[~]
$ cat file.text
Welcome to JavaTpoint
```

# 8. mkdir Command

The 'mkdir' command is used to create directories. For example, if we wish to create a directory named 'Penetration testing' under the 'Documents' directory, then we have to open a terminal and enter the below command:

- 1. cd Documents
- 2. mkdir Penetration testing

# 9. rm Command

In Kali Linux, the **'rm'** command is used to **delete files.** It can be used to delete directories when we use them recursively.

```
(kali@ kali)-[~]

(kali@ kali)-[~/Desktop]

(kali@ kali)-[~/Desktop/Files]

(kali@ kali)-[~/Desktop/Files]

(kali@ kali)-[~/Desktop/Files]

(kali@ kali)-[~/Desktop/Files]

(kali@ kali)-[~/Desktop/Files]

(kali@ kali)-[~/Desktop/Files]

imagel.png java.png picture.png pp.png screen.png
```

#### 10. my Command

With the help of the 'mv' command, we can move or renames files and directories on our file system.

```
(kali@ kali)-[~]
$ cd Desktop

(kali@ kali)-[~/Desktop]
$ ls
files Files firebox keyboard.png

(kali@ kali)-[~/Desktop]
$ mv keyboard.png Files

(kali@ kali)-[~/Desktop]
$ cd Files

(kali@ kali)-[~/Desktop]
$ ls
imagel.png java.png keyboard.png key.png picture.png pp.png screen.png
```

## 11. uname Command

The 'uname' command displays the current system's information. We can view system information about our Linux environment with the uname command in Linux. With the uname -a command, we can learn more about our system, including Kernel Name, Node Name, Kernel Release, Kernel Version, Hardware Platform, Processor, and Operating System.

#### **Syntax**

1. # uname

# 12. uptime Command

The 'uptime' command displays the amount of time the system has been running. Uptime's basic usage is simple: simply type the name of the command and click **Enter.** 

Use the **-p** command-line option if we merely want to know how long the system has been up for and in a more human-readable format.

# **Syntax**

1. # uptime

```
(kali@ kali)-[~/Desktop]
    uptime
09:11:39 up 20 min, 1 user, load average: 0.32, 0.27, 0.28
```

# 13. users Command

The 'users' command is used to display the **login names** of users logged in on the system.

#### **Syntax**

1. # users

```
(kali@ kali)-[~/Desktop]

susers
kali
```

# 14. less Command

In Kali Linux, the **'less'** command is used to view files instead of opening the file. The less command is a more powerful variant of the **"more"** command which is used to show information one page at a time to the terminal.

We can view any text file with the help of the "less" command simply by typing the following command into a terminal window:

#### **Syntax:**

1. # less /etc/passwd

```

```

# 15. more Command

The "more" command permits us to show output in the terminal one page at a time. This is particularly beneficial when using a command that requires a lot of scrolling, such as the 'ls' command or the 'du' commands.

The 'more' command works with any applications that output to the screen. A good way to test this is to type the following command into a terminal window:

#### Syntax:

1. # moreetc/passwd

```
-(kali⊛kali)-[~]
s more /etc/passwd
root:x:0:0:root:/root:/usr/bin/zsh
daemon:x:1:1:daemon:/usr/sbin:/usr/sbin/nologin
bin:x:2:2:bin:/bin:/usr/sbin/nologin

mysql:x:104:110:MySQL Server,,,:/nonexistent:/bin/false
```

## 16. vi Command

The 'vi' editor is a screen editor that comes with practically every **UNIX** system. The **command mode** and the **insert mode** are the two most common nodes in vi.

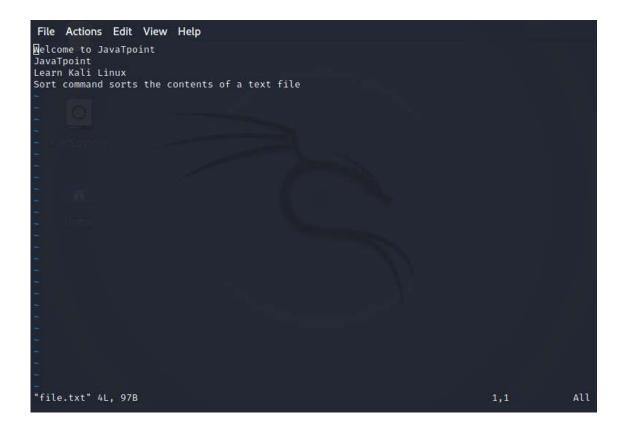

In order to start entering text in an empty file, we have to first switch from the command mode to the insert mode. To accomplish this, start typing the letter i. When we start typing, anything then the type will be entered into the file.

Type some short lines, then press Return at the end of each. **Vi** does not use word wrap like other word processors. It will break a line at the screen' edge. If we make a mistake, we can undo it by pressing the **Backspace** key. If the Backspace key on our computer is not working, then try the **ctrl** + **h** key combination.

```
File Actions Edit View Help

(kali@kali)-[~]

yi file.txt
```

# 17. free Command

In Kali Linux, the 'free' command provides us the useful information about the amount of RAM available on a Linux machine. It also displays the entire amount of physical memory used and available space, as well as swap memory with kernel buffers.

#### **Syntax:**

#### 1. # free

If we use the **free** command with the **-t** option, it would list the total line at the end.

# 18. sort Command

Using the **'sort'** command, we can sort the content of the text file, line by line. Sort is a standard command-line program which prints the lines of its input or concentration of all files listed in its argument list in sorted order.

#### **Syntax:**

1. # sort file name

We can reverse the order of any file's contents by using the **-r** sort.

## **Syntax**

1. # sort -r

```
(kali® kali)-[~]
$ sort file.text
Java
JavaTpoint
Kali Linux
Kali Linux Operating System
Linux
Welcome to JavaTpoint

(kali® kali)-[~]
$ sort -r file.text
Welcome to JavaTpoint
Linux
Kali Linux Operating System
```

# 19. history Command

The 'history' command is one of Kali Linux's most commonly used commands. The history command in the bash shell saves a history of commands entered that can be used to repeat commands.

We can run the history command by itself, and it will just print the **current user's bash history** on the screen, as shown below:

#### **Syntax:**

# 1. # history

```
48 ls
49 uname
50 uname -a
51 users
52 uptime
53 users
54 less usr/share/wordlists
55 less etc/php
57 vi file.txt
58 free
59 cd Documents
```

# 20. Pwd Command

In Kali Linux, the 'Pwd' command is used to print working directory. It gives us information about the directory we are now in. This is especially useful if we need to access the directory while in the middle of a complicated process.
